MIND BOGGLING MATHEMATICAL TRICKS

1. THE MAGIC NUMBER 1089:

- (a) Think of a 3 digit number where the digital sum is descending order (e.g. 421)
- (b) Reverse the digits to form another number (e.g. 123)
- (c) Subtract the smaller number from the larger one (e.g. 421 - 123 = 298)
- (d) Reverse the digits of the result (e.g. 298 becomes 892)
- (e) Add this number to the result (e.g. 298 + 892 = 1180)

2. MULTIPLYING BY 11 IN A SNAP:

- (a) Take any two-digit number (e.g. 45)
- (b) Separate the digits (4 and 5)
- (c) Add the two digits together (4 + 5)
- (d) Place the sum between the original digits (495)
- (e) If the sum of the digits is greater than 9... just add 1 to the first digit and place the second digit in the middle. For example, 47 becomes 4(1)7 = 4(1)7 = 529

3. THE FINGER MULTIPLICATION TRICK FOR 9s:

- (a) Stand with both hands up and fold down the finger that corresponds to that component of the numbers. You want to multiply by 9, starting from your left hand.
- (b) Count the fingers to the left of right of the folded finger. The number to the left of yours finger is tens digit and the number to the right digit.
- (c) For example, to find 39 - put down the finger number 6. The number of fingers before it is the first digit (3) and the fingers after it have the second digit (9). The answer is 39.

Theorem: The tangent at any point of a circle is perpendicular to the radius through the point of contact.

Proof: We are given a circle with centre O and a tangent XY to the circle at a point P. We need to prove that OP is perpendicular to XY.

The point Q must lie outside the circle.

If Q lies inside the circle, XY will become a secant and not a tangent to the circle. Therefore, QO is longer than the radius OP of the circle. That is, $QO > OP$.

Since this happens for every point on the line XY except the point P, OP is the shortest of all the distances of the point O to the points of XY. As OP is perpendicular to XY.

GEOMETRIC PROOF OF WHOLE SQ FORMULA

Formula: $(a+b)^2 = a^2 + 2ab + b^2$

Geometric Proof: Here a square of length $a+b$ is given. Thus its area is $(a+b)^2$. Now we will calculate the area of the big square by adding up the areas of the four squares and rectangles that are forming the big square.

Here there is a square of area a^2 . There are two squares of area b^2 . Area of two rectangles are ab each. So the total area will be $a^2 + 2ab + b^2$.

$$\begin{aligned} & a^2 + b^2 + ab + ab \\ & = a^2 + 2ab + b^2 \\ & = (a+b)^2 \end{aligned}$$

Thus area is equal to the square of length $a+b$.

Hence $(a+b)^2 = a^2 + 2ab + b^2$
